

WP6 Early estimates

Workpackage 6 (WP6) of [ESSnet Big Data](#) aims to investigate multiple data sources of different types (big data, administrative data and others) in order to produce **early estimates** for statistical purposes. Among those sources the most promising ones will be identified and use cases will be developed; the focus is on two domains expected to yield 'quick wins':

- social media data, newsfeeds and survey data for a consumer confidence index;
- web-based sales inquiries for nowcasting turnover indices.

As WP6 addresses many cross-cutting issues such as methodology, quality and technical requirements, there are links with workpackages [7 \(Multiple domains\)](#) and [8 \(Methodology\)](#). More background information on WP6 can be found [here](#).
